Modifying fatty biomass and prod producing acid metabolism in specific n in plants, useful polymers in seeds for increasing

79pp;

is used to construct plasmids for the expression of the p. putida CC faoAB gene. The gene encodes an enzyme that may be used in the CC method of the invention. The specification describes a method for CC manipulating the metabolism of a plant, and comprises expressing a CC heterologous gene encoding fatty acid oxidation enzymes in the CC cytosol or plastids other than the peroxisomes, glyoxisomes or CC mitochondria of the plant. The method may be used to enhance the CC biological production of polyhydroxyalkanoates or novel oil compositions CC in a transgenic plant. Plants which may be used to produce these CC compounds in this way include Brassicas, maize, soybean, cottonseed, cunflower, palm, coconut, safflower, peanut, mustards, flax, tobacco and alfalfa. The method may also be used to production and therefore increase the production of biomass (leaves. CC stems, stalks) by plants. compositions and

Chymosin can be produced in a plant seed through introduction of a chimeric nucleic acid molecule, comprising a nucleic acid sequence encoding a chymosin polypeptide operatively linked to transcription regulator and terminator sequences, into a plant cell. Th sequences are useful for producing plant seeds, in particular seeds of soybean, rape seed, sunflower, cotton, corn, tobacco, alfalfa, wheat, barley, oats, sorghum, Arabidopsis thaliana, potato, flax/linseed, safflower, oil palm, groundnut, Brazil nut, coconut, castor, coriander, squash, jojoba and rice.

cc expression constructs to lower soybean vacuolar protein, commonly known cc as p34 (Gly m Bd 30K or Gly m 1) and other allergens such as Gly m IA, CC Gly m IB, rGLY m3 or Glycinin G1 (alaBlb). The allergen content of the expression is reduced by sense suppression which is accomplished by using CC the expression construct that comprises a nucleic acid fragment encoding CC transgenic soybean plants which can be used to make hypoallergenic CC soybean products which can be used to make hypoallergenic CC soybean products which can be used in a variety of food (e.g. infant CC formulas) and animal feed applications. The oil made from seeds of the hypoallergenic transgenic soybean plants can be used as ingredients, CC as coatings, as salad oils, as spraying oils, as roasting oils, and snack foods, confectionery products, syrups and toppings, sauces, CC batter and breading mixtures, baking mixes and doughs. The present CC sequence is a DNA encoding kunitz soybean trypsin inhibitor (KSTI CC cor KTi3), a minor soybean seed allergen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Recombinant expression construct to lower allergen (e.g. Gly content of a soybean, comprises a nucleic acid fragment encocallergen, useful for producing soybean plants which can be useful for producing soybean plants which can be useful for producing soybean plants which can be useful for producing soybean plants.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
The DNA is that of a mammalian gene (open reading frame) encoding chymosin. The gene was placed in operable linkage with the al-3 promoter (see AAT03005). The al-3 gene controls the production of geranyl geranyl pyrophosphatase (GGPP) synthetase. GGPP is a precurso for carotenoids and xanthophylls. It has been shown that exposure to light increases the transcription level of GGPP synthetase 15-45 fold. Light activates a number of genes in the common bread mould, Neurospor This can be used to regulate the expression of genes encoding

The pLC7 prorennin expression plasmid includes sequences which code for both the pseudorennin and mature rennin cleavage sites between AAs 28-29 and AAs 42-43, respectively.

GAL1 promoter linked to gene - useful for direction of expression of the gene in yeast ce The recombinant material carrying a GAL1 promoter of the yeast galactokinase gene may be used in expressing a desired protein, e bovine growth hormone, interferon, prorennin or preprorennin, in yeast cell. Strains of Saccharomyces cerevisiae producing the polypeptides are produced. Yeast strains deposited as ArCC 20643, 20661, 20662 and 20663, strain designations CGY 196, 457, 461 and 528, resp. are new.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence of

The heterologous peptide or protein may also be human insulin-like growth factor I. The constructs provide high yields of the protein with simple recovery from the milk. Activation of the gene occurs only in the mammary gland. See also AAQ14050, AAQ14774-77.

The DNA which encodes a chimeric fusion protein that consists of the oil-body targeting sequence, a transcription regulation sequence an DNA of the protein of interest can be used to produce antibodies, glycanases, hormones, proteases, protease inhibitors, seed storage proteins, thrombin inhibitors, hirudin, interleukins, chymosin, cys xylanase, carp growth hormone, zein or a collagenase. The enzyme may be cleaved from the oil body protein or used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             25-APR-1997;

                                                                                                                                                                                                                                                                                                                                                association with the oil body fraction.

Allows production of commercially important proteins on a superior to production by conventional systems. The expressed heterologous protein can be easily separated from host cell components due to the use of the oil body as a carrier protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This is the nucleotide sequence of a HindIII fragment containing the oleosin-spacer-Met-prochymosin sequence. This HindIII fragment was joined to a nopaline synthase terminator and cloned into binary vector pCGN1559. The resulting plasmid was called pSBSOTFINT and introduced into A.tumefaciens. The resulting bacterial strain was used to transfole.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Expression of a useful for the

Any portion of the nucleotide sequence as described in AAN40055 can be used. Also claimed is a vector derived from plasmid pBR322. Typically plasmid pCR501 is obtd. from pOCT 2. The transcriptional direction of pOCT 3 is opposite to that of the poct of the composite counter of the com
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1669
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Beppu T,

double-stranded cDNA was size selected, ligated to Eco RI adapters (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of a modified pT7T3 vector (Pharmacia). Library went through one round of normalization to a Cot = 5. Library constructed by Bento Soares and M.Fatina Bonaldo. RNA was kindly provided by Dr. Minoru Ko (Wayne State University)."

CDNA library was prepared and sequenced in Mouse Genome Encyclopedia Project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in RIKEN. Division of Experimental Animal Research in Riken contributed to prepare mouse tissues. First strand CDNA was primed with a primer [5' GAGAGAGAGGATCCAAGAGCTCTTTTTTTTTTTTTTVN 3'], CDNA was prepared by using trehalose thermo-activated reverse transcriptase and subsequently enriched for full-length by cap-trapper. CDNA went through one round of normalization to Rot = 5.0 and subtraction Rot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Direct Submission
